

Fact Sheet: How DCM works

DCM uses intelligent technology to detect and measure characteristics using CCTV, or any camera providing an IP protocol feed. The measurements are then processed on the Amazon Web Services (AWS) platform and visualised within a real-time dashboard. The outcome is that DCM provides the world's most effective insights for people management.

DCM's core measurements include Density, Velocity (speed and flow) and Mood, with the system capability extending to Attention and Social Distancing Compliance.
